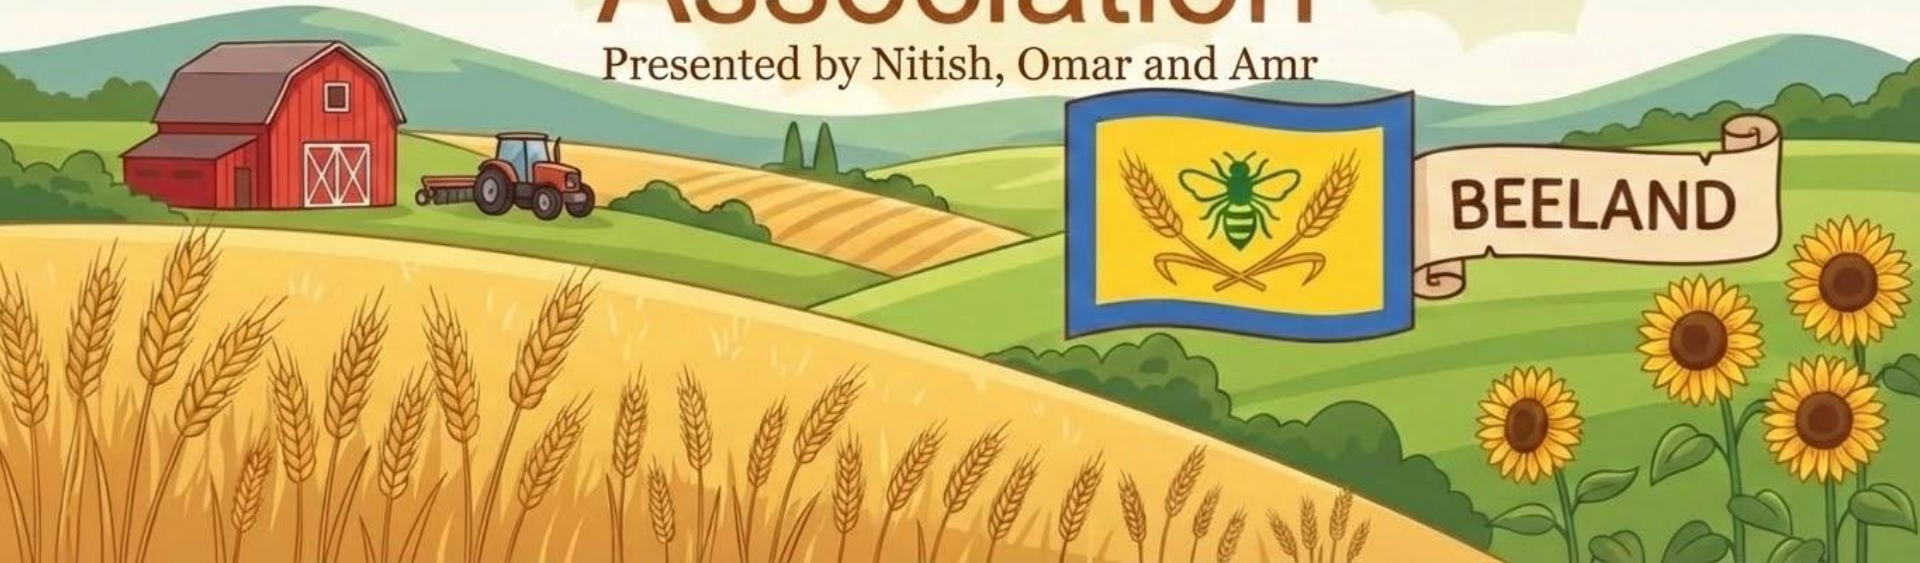
Beeland Farmers' Association

Presented by Nitish, Omar and Amr



Background: Adverse Effects of Intentional Rain Research (IRR)

- Topsoil has washed away, reducing agricultural dryland.
- Neighboring regions are experiencing drought conditions.
- The honeybee population has declined, negatively impacting harvests and nature's ability to pollinate fields.
- The targeted area in the Southeast Abuntia has seen a steep decrease in rainfall.
- In response, honeybee farmers organized a public letter of protest to the UN and IRR, demanding an immediate halt to the project.

Normative Ethics

Kantian Ethics:
Unfair Advantage

It's working for them but not for us - unfair. The duty to one group should not come at the expense of another.

Consequentialism:
Disrupted Equilibrium

In Nature everything is in equilibrium. Actions have far-reaching consequences that disrupt the balance.

Virtue Ethics:
Neglected Responsibility

It's not virtuous just for benefit of 1 group you hurt others (humans, bees, plants, nature).

Key Ethical Concerns from our Perspective:

Lack of transparency: The problem is not known if it's related to complex weather or the machine learning model

Lack of consent: We didn't consent for using Intentional rain in our land or Dryland

Didn't explore the risks: there hasn't been enough research or risk assessment globally

Lack of responsiveness: the project still hasn't been shut down

Lack of responsibility: Nobody is taking responsibility for this crisis

Our arguments:

Decline in bee population

Honeybee numbers are dropping significantly

Harvest affected

Agricultural yields are suffering

Impeding nature's ability to pollinate the field

Natural pollination cycles are disrupted

Global decrease in food

Leading to potential food scarcity worldwide

Potential Compromises or Solutions:

A: Stop the Project

Stop the rain system in Beeland.

Stop more **damage to crops** and **bees**.

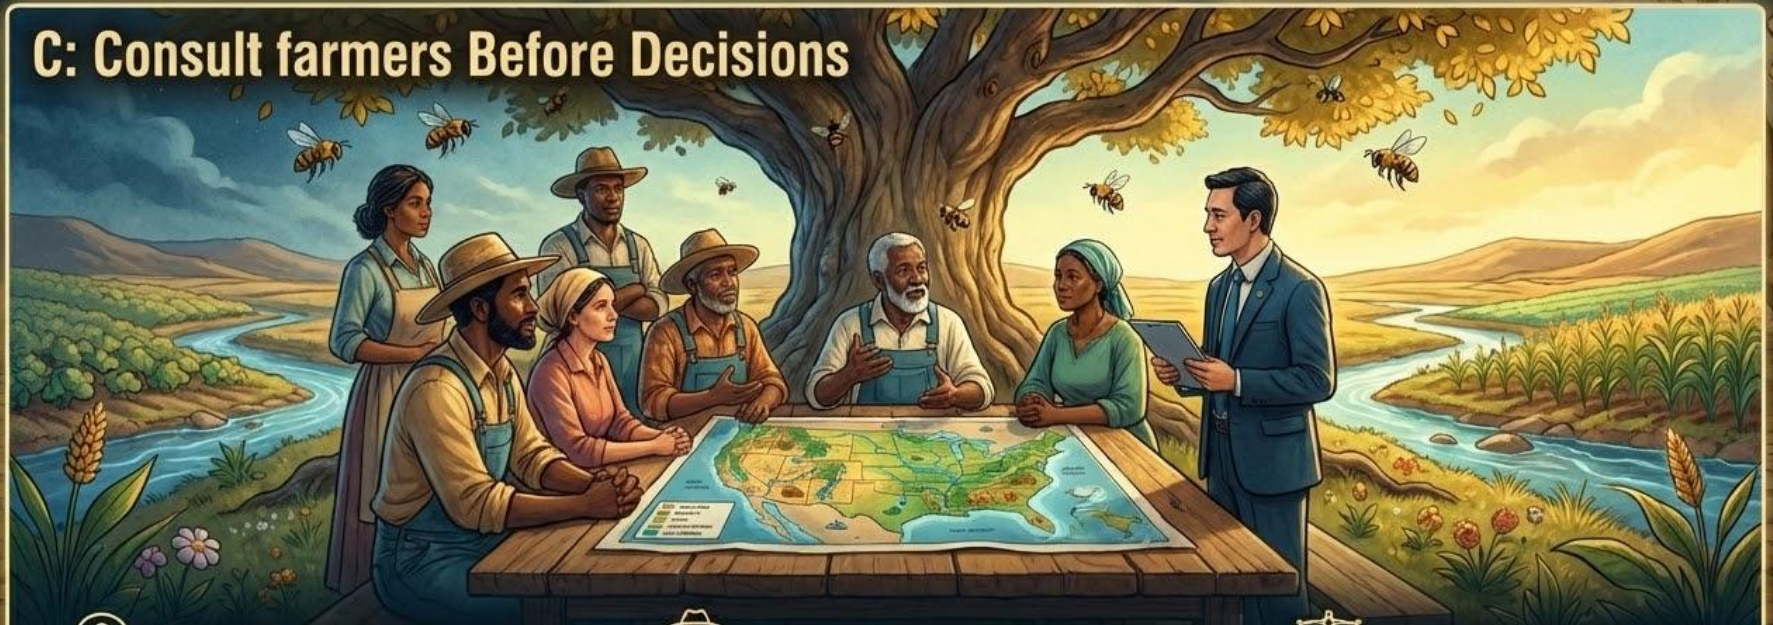
B: Financial Support

Give **money to farmers** for lost crops and honey.

Help Agricultural communities **recover quickly**.

Potential Compromises or Solutions:

C: Consult farmers Before Decisions



Ask Beeland farmers before using this system again.

Farmers **know local risks** and can help prevent problems.

Decisions will be **fair and safe.**

Conclusion

The Intentional Rain project **caused harm to farmers, honeybees, and the environment** in Beeland, showing the risks of controlling nature without proper safeguards.

While the project aimed to help some regions, it **ignored local communities and their knowledge**, leading to unintended negative consequences.

Beeland farmers **demand responsible action, fair compensation**, and **inclusion in future decisions** to ensure innovation is safe, fair, and benefits all.

Question for IRN

Did you **test your product** or conduct a **full risk assessment** before deploying it in Beeland?

Question for UN

Why didn’t the UN **assess the global risks before approving and deploying** the Intentional Rain project?

Question for EA

Did you **discuss potential impacts** with **affected communities**, such as Beeland farmers, before **supporting the project**?
